2013 Annual Drinking Water Quality Report

(Consumer Confidence Report) Sunrise Ranch PWS # TX1700686 936-756-7400

Annual Water Quality Report for the period of January 1 to December 31, 2013

This report is intended to provide you with important information about your drinking water and the efforts made by the water system to provide safe drinking water.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by call the EPAs Safe Drinking Water Hotline at (800) 426-4791.

For more information regarding this report contact:

Name: Ronald L. Payne Phone: 936-756-7400

En Español: Este informe incluye información importante sobre el agua potable. Si tiene preguntas o comentarios sobre éste informe en español, favor de llamar al tel. 936-756-7400 para hablar con una persona bilingüe en español.

SPECIAL NOTICE

Required language for ALL community public water supplies:

You may be more vulnerable than the general population to certain microbial contaminants, such as Cryptosporidium, in drinking water. Infants, some elderly or immune compromised persons such as those undergoing chemotherapy for cancer; those who have undergone organ transplants; those who are undergoing treatment with steroids; and people with HIV/AIDS or other immune system disorders can be particularly at risk from infections. You should seek advice about drinking water from your physician or health care provider. Additional guidelines on appropriate means to lessen the risk of infection by Cryptosporidium are available from the Safe Drinking Water Hotline at (800) 426-4791

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. We cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick-up substances resulting from the presence of: Contaminants that may be present in source

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and
- Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and
 - Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

Information about Secondary Constituents - Many constituents (such as calcium, sodium, or iron) which are often found in drinking water, can cause taste, color, and odor problems. The taste and odor constituents are called secondary constituents and are regulated by the State of Texas, not the EPA. These constituents are not causes for health concern. Therefore, secondaries are not required to be reported in this document but they may greatly affect the appearance and taste of your water.

Information about Source Water Assessments: A Source Water Susceptibility Assessment for your drinking water sources(s) is currently being updated by the Texas Commission on Environmental Quality. This information describes the susceptibility and types of constituents that may come into contact with your drinking water sources based on human activities and natural conditions. The information contained in the assessment allows us to focus source water protection strategies

For more information about your sources of water, please refer to the Source Water Assessment Viewer available a the following URL: http://gis3.tceg.state.tx.us/swav/Controller/index.jsp?wtrsrc=

Further details about sources and source water, assessments are available in Drinking Water Watch at the following URL: http://dww.tceg.texas.gov/DWW/

Water Quality Test Results

Maximum Contaminant Level Goal or -The level of a contaminant in drinking water below which there is no known or expected risk to health. MGLGs allow for a margin of safety Maximum Contaminant Level or MCL: -The highest level of a contaminant that is allowed in drinking water. MCLs are not as close to the MCLGs as feasible using the best available treatment technology. Maximum residual disinfectant level goal or -The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not MRDLG reflect the benefits of the use of disinfectants to control microbial contaminants. Avg: -Regulatory compliance with some MCLs are based on running annual average of monthly samples -milligrams per liter or parts per million - or one ounce in 7,350 gallons of water ppm: ppb: -micrograms per liter or parts per billion - or one ounce in 7,350 gallons of water

The following tables contain scientific terms and measures, some of which may require explanation Definitions::

Colotorm Bacte	ria	
Maximum	Total Coliform Maximum	

Contaminant Level Goal	Contaminant Level	Positive		Coli Maximun Contaminant Le	n	E.C	coli or Fecal orm Samples	Violation	iolation				contamination
